

## Java\_Script\_Day1\_<No-1>\_Hands\_On\_Gunta Divya:

**Assessment Goal:** Ensure learners understand responsiveness and screen adaptability.

### Hands-on Tasks:

1. Add viewport meta tag to the HTML page
2. Use media queries to:
  - o Change background color on mobile screen
  - o Adjust font size for smaller screens
3. Convert navigation into vertical layout on mobile
4. Test the page using browser responsive mode

### Expected Outcome:

A webpage that looks different and readable on mobile and desktop screens

### CODE:-

```
<!DOCTYPE html>
<html lang="en">
<head>
  <meta charset="UTF-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <title>Mobile page screen</title>

<style>
  body{
    margin : 0;
    font-family: Arial, Helvetica, sans-serif;
    background-color: green;
    font-size: 20px;
  }
  header{
    background-color: rgb(180, 80, 75);
    color: white;
    padding: 15px;
    text-align: center;
  }
  nav ul{
    display: flex;
    list-style: none;
    margin: 0;
    padding: 0;
    justify-content: center;
    gap: 18px;
    background-color: bisque;
  }
  nav ul li{
    padding: 10px;
  }
```

```

nav ul li a {
    color: white;
    text-decoration: none;
}
main{
    padding:10px;

}
@media(max-width: 600px){
    body{
        background-color:blue;
        font-size: 16px;
    }
    nav ul{
        display: block;
        text-align: center;
    }
    nav ul li{
        margin: 10px;
    }
}

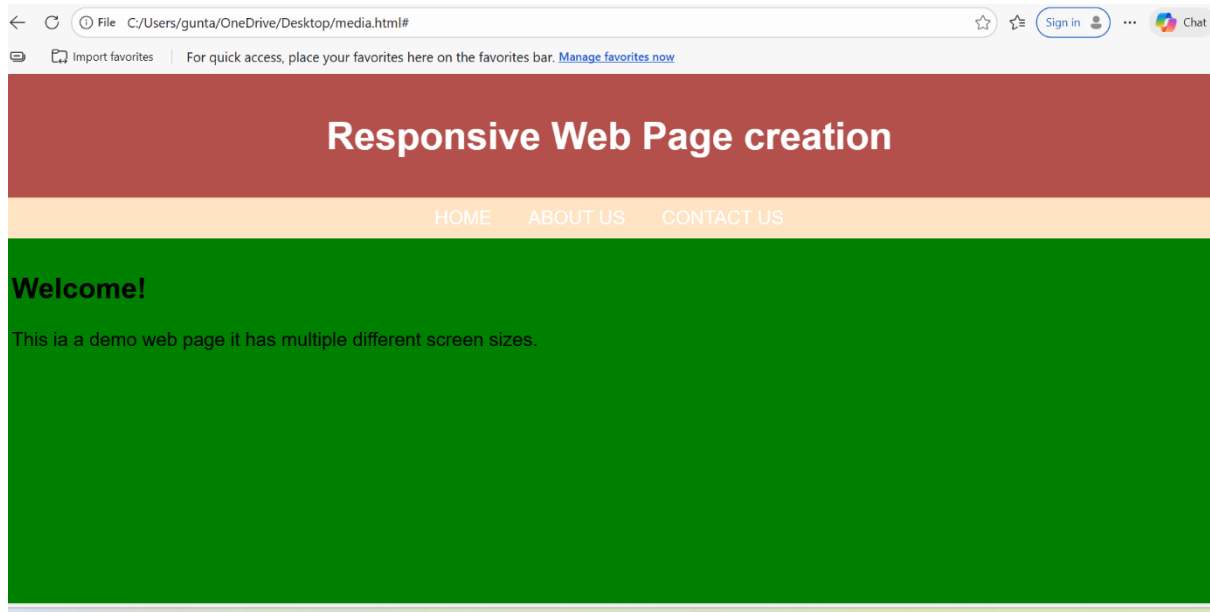

</style>
</head>
<body>
    <header>
        <h1>Responsive Web Page creation</h1>
    </header>

    <nav>
        <ul>
            <li><a href = #>HOME</a></li>
            <li><a href = #>ABOUT US</a></li>
            <li><a href = #>CONTACT US</a></li>
        </ul>
    </nav>
    <main>
        <h2>Welcome!</h2>
        <p>This ia a demo web page it has multiple different screen sizes.</p>
    </main>

</body>
</html>

```

**OUTPUT:-**

### Code Explanation:-

This code creates a responsive web page that adapts to different screen sizes. The viewport meta tag allows the layout to scale correctly on mobile devices. Media queries are used to change the background color and reduce the font size on smaller screens, making the content easier to read. The navigation menu changes from a horizontal layout on desktop to a vertical layout on mobile screens, improving usability. As a result, the webpage looks clear and readable on both desktop and mobile devices.

### Java Script\_Day1\_<No-2>\_Hands\_On\_Gunta Divya:

#### Assessment Goal:-

A school wants a simple JavaScript program to evaluate a student's performance based on marks obtained in a subject.

#### Requirements

- Accept the student's marks as a variable
- Use if-else statements to assign grades:
  - Marks  $\geq 75$   $\rightarrow$  Grade A
  - Marks  $\geq 60$   $\rightarrow$  Grade B
  - Marks  $\geq 40$   $\rightarrow$  Grade C
  - Marks  $< 40$   $\rightarrow$  Fail

Display the grade on the web page or console

#### Technical Constraints

- Use JavaScript variables (let or const)
- Use numeric data types
- Use comparison and logical operators
- No functions or arrays allowed
- Output using console.log() or document.write()

#### Learning Outcome

You should be able to:

- Declare and use variables
- Apply comparison operators
- Implement conditional logic using if–else
- Understand decision-making in JavaScript

**CODE:-**

```
let marks = Number(prompt("Enter marks"));
```

```
if(isNaN(marks) || marks < 0 || marks > 100)
```

```
{
```

```
    console.log("Invalid input");
```

```
}
```

```
else if (marks >= 75 && marks<100)
```

```
{
```

```
    console.log("Grade A");
```

```
}
```

```
else if (marks >= 60 && marks<75)
```

```
{
```

```
    console.log("Grade B");
```

```
}
```

```
else if (marks >= 40 && marks<60)
```

```
{
```

```
    console.log("Grade C");
```

```
}
```

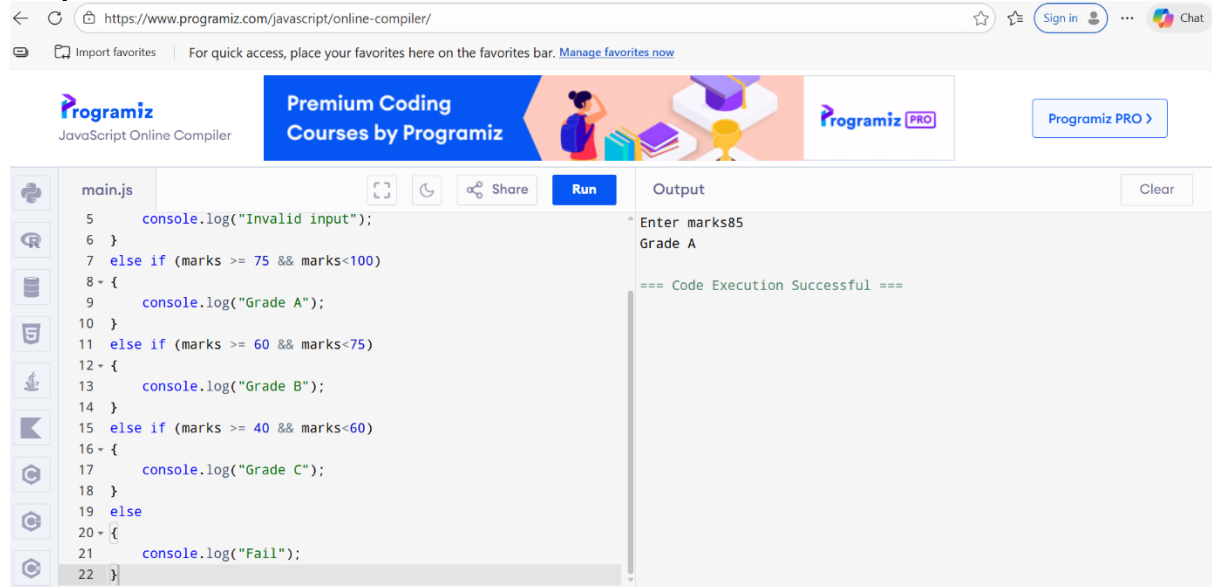

```
else
```

```
{
```

```
    console.log("Fail");
```

```
}
```

## Output:-

The screenshot shows the Programiz JavaScript Online Compiler interface. The code editor on the left contains a JavaScript file named 'main.js' with the following code:

```
5 console.log("Invalid input");
6 }
7 else if (marks >= 75 && marks<100)
8 {
9 console.log("Grade A");
10 }
11 else if (marks >= 60 && marks<75)
12 {
13 console.log("Grade B");
14 }
15 else if (marks >= 40 && marks<60)
16 {
17 console.log("Grade C");
18 }
19 else
20 {
21 console.log("Fail");
22 }
```

The 'Run' button is highlighted. The output panel on the right shows the following text:

```
Enter marks85
Grade A
=== Code Execution Successful ===
```

## Code Explanation:-

This JavaScript code evaluates a student's grade based on the marks entered by the user. The marks variable stores numeric input using `Number(prompt())`. An if–else ladder is used to check conditions with comparison and logical operators. If the input is invalid (not a number or outside 0–100), an error message is shown. Otherwise, grades A, B, or C are assigned based on the marks, and marks below 40 result in “Fail”. The output is displayed using `console.log()`, demonstrating simple decision-making in JavaScript.

## HTML\_5\_<No-3>\_Hands\_On\_Gunta Divya:

### Assessment Goal:-

An online store wants to apply a discount based on the total purchase amount.

### Requirements

- Store purchase amount in a variable
- Apply discount rules:
  - Amount  $\geq 5000 \rightarrow$  20% discount
  - Amount  $\geq 3000 \rightarrow$  10% discount
  - Amount  $< 3000 \rightarrow$  No discount
- Calculate and display:
  - Discount amount
  - Final payable amount

### Technical Constraints

- Use arithmetic operators
- Use if–else statements

- Use only primitive data types

No user input (hardcoded values allowed)

### **Learning Outcome**

You will be able to:

- Perform calculations using operators
- Work with expressions
- Apply conditional statements
- Build real-world logic using JavaScript basics.

### **CODE:-**

```
let amount=8000;
let discountpercentage;
if(amount>=5000)
{
    discountpercentage=20;
}
else if(amount>=3000)
{
    discountpercentage=10;
}
else
{
    discountpercentage=0;
}
let discount_amount=(amount*discountpercentage)/100;
let final_payableamount=amount - discount_amount;
console.log("amount:",amount);
console.log("discountpercentage is",discountpercentage + "%");
console.log("discount amount is",discount_amount);
console.log("final payment is",final_payableamount);
```

### **OUTPUT:-**

The screenshot shows the Programiz JavaScript Online Compiler interface. The code in the editor is as follows:

```
1 let amount=8000;
2 let discountpercentage;
3 if(amount>=5000)
4 {
5     discountpercentage=20;
6 }
7 else if(amount>=3000)
8 {
9     discountpercentage=10;
10 }
11 else
12 {
13     discountpercentage=0;
14 }
15 let discount_amount=(amount*discountpercentage)/100;
16 let final_payableamount=amount - discount_amount;
17 console.log("amount:",amount);
18 console.log("discountpercentage is",discountpercentage + "%");
```

The output on the right shows the results of the code execution:

```
amount: 8000
discountpercentage is 20%
discount amount is 1600
final payment is 6400
=== Code Execution Successful ===
```

### Code Explanation:-

This JavaScript code calculates a discount for an online store based on a fixed purchase amount. The amount variable stores the total purchase value, and an if–else statement determines the applicable discount percentage according to the given rules. Arithmetic operators are then used to calculate the discount amount and subtract it from the original amount to get the final payable amount. All results, including the original amount, discount percentage, discount amount, and final payment, are displayed using console.log(). This demonstrates the use of variables, calculations, and conditional logic to solve a real-world problem.

### HTML\_5\_<No-4>\_Hands\_On\_Gunta Divya:

#### Assessment Goal:-

A traffic control system needs a JavaScript program that displays instructions based on traffic signal color.

#### Requirements

- Store signal color in a variable ("red", "yellow", "green")
  - Use a **switch statement** to display:
  - Red → Stop
  - Yellow → Get Ready
  - Green → Go
- Handle invalid signal input gracefully

#### Technical Constraints

- Must use switch–case
- Use string data types
- Use console.log() for output
- No if–else allowed

#### Learning Outcome

Learners should be able to:

- Use switch statements effectively

- Compare string values
- Handle multiple conditions cleanly
- Understand control flow alternatives

### CODE:-

```
let color=prompt("enter a color like red,yellow,green");
switch(color.toUpperCase())
{
case "RED":
  console.log("Stop");
  break;
case "YELLOW":
  console.log("Get,Ready");
  break;
case "GREEN":
  console.log("Go");
  break;
default:
  console.log("Invalid signal color");
}
```

### Output:-

### Code Explanation:-

This JavaScript program displays traffic instructions based on the signal color entered by the user. The signal color is stored as a string variable and converted to uppercase to ensure case-insensitive comparison. A switch-case statement is used to match the color with the appropriate instruction: red shows "Stop", yellow shows "Get Ready", and green shows "Go". If the input does not match any valid signal color, the default case handles it gracefully by displaying an error message using `console.log()`.

HTML\_5\_<No-5>\_Hands\_On\_Gunta Divya:

### Assessment Goal:-

A utility program is required to analyze numbers and provide insights such as positivity, parity, and range.

### Requirements

- Store a number in a variable
- Use **conditional (ternary) operator** to check:
  - Positive or Negative
- Use **if-else** to check:
  - Even or Odd
- Use a **loop** to print all numbers from 1 to the given number

### Technical Constraints

- Store a number in a variable
- Use conditional (ternary) operator to check:
  - Positive or Negative
- Use if-else to check:
  - Even or Odd
- Use a loop to print all numbers from 1 to the given number

### Learning Outcome

You will be able to:

- Combine multiple control flow techniques
- Use loops for iteration
- Apply conditional operators
- Build multi-step logical programs

### CODE:-

```
let number=Number(prompt("enter a number"));
let a=(number>0)?"Positive":"Negative";
{
  console.log(a);
}
if(number%2==0)
{
  console.log("Even");
}
else
{
  console.log("Odd");
}
let i=1;
while(i<=number)
{
  console.log(i);
  i++
}
```

### OUTPUT:-

```
main.js
4 console.log(a);
5 }
6 if(number%2==0)
7 {
8   console.log("Even");
9 }
10 else
11 {
12   console.log("Odd");
13 }
14 let i=1;
15 while(i<=number)
16 {
17   console.log(i);
18   i++;
19 }
20
21
```

Output

```
enter a number7
Positive
Odd
1
2
3
4
5
6
7

=== Code Execution Successful ===
```

### Code Explanation:-

This JavaScript program analyzes a number entered by the user and provides multiple insights about it. The number is stored in a variable and a conditional (ternary) operator is used to check whether the number is positive or negative. An if–else statement then determines whether the number is even or odd using the modulus operator. Finally, a while loop prints all numbers from 1 up to the given number. This program demonstrates the combined use of conditional operators, decision-making, and loops to build a multi-step logical solution.
